DETAILED ACTION

Claim Rejections - 35 USC § 102

1. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claim Rejections - 35 USC § 103

2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

3. Claims 1-10 are rejected under 35 U.S.C. 102(b) as anticipated by or, in the alternative, under 35 U.S.C. 103(a) as obvious over Koemtzopoulos et al. (US 6,017,414; hereinafter "Koemtzopoulos").

In a method of detecting and controlling the cleaning of the processing chambers that are used for etching process, Koemtzopoulos teaches that a DC bias voltage of a plasma generator may be monitored during a cleaning etching process. The DC bias

Art Unit: 1765

voltage may be compared to a predetermined value representing a clean processing chamber, The plasma cleaning etching process may be terminated when the DC bias voltage reaches the predetermined value. When the process is terminated, it is expected that the supply of process gases is to be disconnected and the plasma generator is to be deactivated. Koemtzopoulos also teaches DC bias voltage is measured continuously and at discrete intervals. The DC voltage profile (or a plurality of DC voltage profiles) of a plasma cleaning etching process may be stored. The stored DC voltage profile may be compared with a previously stored DC voltage profile. The comparison performed for the same process gases and process parameters is expected. See col. 6, lines 11-33; col. 7, lines 4-19; col. 8, lines 29-47.

As to claim 10, Koemtzopoulos teaches that the termination of the cleaning etching process may be delayed for a selected time after the DC bias voltage reaches the predetermined value (col. 7, lines 55-60).
